NCPower implemented parliamentary television project in «Deutscher Bundestag», GermanParliament.

«Deutscher Bundestag» has chosen NCPower as the Managing Software (MAM) for parliamentary television. The mission was to create and install a production environment that optimizes the planning, control and dissemination of parliamentary television content.

The introduction of NCPower has simplified existing workflows and made them more efficient. With the help of NCPower, the Bundestag combined all components of parliamentary television: a system of reproduction, Teletext, graphics, matrix management, playlists and metadata for external service providers and for the Bundestag archive.

Ncpower has successfully integrated various rendering mechanisms into the production process to provide an effective and up-to-date solution in the area of digital visual effects and graphics integration for television and the Internet.

NCPower realized the opportunity to develop and implement a new design, to make an operative update of the ethereal graphics. The main components of the solution are the new metadata export channel to deliver the required program information for the replay system and rendering engine, rendering engine for preparing the media templates in Adobe After Effects and their Rendering using Adobe Encoder in the background, as well as the transport service delivering the generated video clips for playback.

Bundestag television is a 2 channel system with the possibility of extending up to 4 channels. The system of new graphic design will be implemented from mid-June 2019 year on all channels.

The Bundestag is pleased with the system decision and has extended cooperation with NCPower for the next 4 years.
